The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid

This sequence is the MTS polypeptide MTSI must polypeptide MTSI polypeptide MTSI polypeptide MTSI converted diagnosis or prognosis of human cancer. Germ-line mutations of the Storm of the MTS converted for diagnosing predisposition to melanoma, isolated and cancers of the pancreas, thyroid, ovary, uterus, lymphoma, CLL and cancers of the pancreas, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The wild-type gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also the polypeptides or cells contg. an altered MTS gene are useful for screening for potential cancer theraponal may be setted for screening for potential cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-JUN-1994;

                                                                                                                                                                                                                                                                                                                                                       The cell cycle gene implicated most strongly in oncogenesis is the Chuman cyclin D1. It is genetically linked to the bcl-1 oncogene, a clocus activated by translocation to an immunoglobulin gene enhancer in some B-cell lymphomas and leukaemias. D-type cyclin, cyclin dependant kinase (CDK), PCNA (proliferating cell nuclear antigen) and CDR1 (a 21 kDa polypeptide) exist in a quaternary complex that many combinatorial variations of the components e.g. cyclin D1 or D3 and CDR2, CDR4 and CDR5, assemble in vivo. Each quaternary complex may have a subrly different role in the cell cycle or in different cell types. Cellular transformation by DNA tumour viruses such as SV40 is associated with selective subunit rearrangement of the cyclin D complexes. In virally transformed cells, CDR4 totally dissociates from cyclin, PCNA and p21 and becomes associated with a 16 kilodalton polypeptide (p16). This sequence, designated p16INK4, binds to and inhibits CDR4, p16INK4 was discovered to show many similarities to recognise the interactions between the CDR's cyclins, PCNA and low collegists which to allow the collegists and content to the cyclins and content to the cyclins between the CDR's cyclins.
                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The human cell-cycle regulatory (CCR) protein p16 (AAR85116) was obtd. by expression of a cDNA clone (AAR702962) isolated in a 2-hy screening assay. CCR p16 specifically inhibits the activity of cyclin-dependent kinases during various stages of the cell cycle, and can be used in the treatment and diagnosis of proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cell-cycle regulatory protein p16; cyclin-dependent kinase inhibitor; CCR; cancer; cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAR85116 standard; Protein; 156 AA.

                                                                                                                                                                                                                                                                                                     The present invention describes a transgenic mouse having germline and somatic cells which comprise an incorporated transgene that disrupts and inhibits the p16-INK4-a gene leading to tumour susceptibility. Also described is a method of making a mouse and mouse embryonic stem cells a functionally disrupted p16-INK4-a gene which comprises transferring a transgene construct into embryonic stem cells of a mouse and transferring these into a mouse blastocyst and implanting the resulting chimeric blastocyst into a female mouse selecting offspring having an endogenous p16-INK4-a gene allele. The transgenic mouse is useful for evaluating the carcinogenic potential or the anti-proliferative activity of a test compound. The present sequence represents the human INK4 protein p16 given in the present invention.

This sequence represents the human cell cycle regulatory protein (CCR) pl6 amino acid sequence. The pl6 gene is located on chromosome 9p21-22. The invention relates to a diagnostic assay which comprises detecting a mutation in the pl6 gene, which is used to identify a cell or cells at risk of developing a disorder characterised by unwanted cell proliferation or differentiation. Pl6 is a cyclin-dependent kinase (CDK)-inhibitory protein, and functions as an inhibitor of cell-cycle progression and ultimately cell growth. The assay can be used for identifying a cell or cells at risk for a disorder (neoplasia) characterized by unwanted cell proliferation or differentiation. The method is used for detecting mutations in either a CCR gene or CDK gene which a the control of the compression of the central proliferation is neither a CCR gene or CDK gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-APR-1994;

                                                which alter complex formation between these two proteins. The method is also used for detecting mutations in other callular proteins which disrupt protein interactions such as mutations which disrupt binding of the p53 protein with other cellular proteins, e.g. Wilm's tumour suppressor protein WT1. They can also be used to detect mutations in pairs of signal transduction proteins such as ras protein or other cellular proteins (GAPs). The method is convenient for detecting mutants of CCR genes encoding proteins which interact with ras, e.g. ras GTPase activating proteins encoding proteins which are unable to physically interact with a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δÃ
                     degeneration of tissue, e.g. Alzheimer's, Parkinson's or Huntington's diseases, gastric ulcers and autonomous diseases of the peripheral nervous system. Other applications include reducing growth of hair and protecting hair follicle cells against cytotoxic treatments, cosmetically to treat various forms of folliculitis, and to inhibit spermatogenesis or oogenesis. The chimeric proteins can also be used in vitro to maintain cells, especially neurons intended for testing specific activity of trophic factors, at selected points in the cell cycle. The proteins are more active inhibitors of the CDK/cyclin complex than binding mottifs used individually (since they may bind to CDK involved in different stages of
                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a chimeric polypeptide of the invention. It was derived from a fusion of the human p27 and p16 cDNA sequences. The chimeric polypeptides of the invention have cyclin-dependent kinase (cDK) binding motifs from at least two different proteins that bind to CDKs. The protein controls proliferation and/or differentiation of cells, particularly they inhibit cell-cycle progression. They can be used to
                                                                                                                                                                                                                                                                                                          treat a wide range of proliferative disorders, e.g. cancer, leukaemia, psoriasis, atherosclerosis, restenosis, chronic inflammation etc. They can also treat diseases associated with de-differentiation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 40; Page 38-40;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric inhibitor of

The invention relates to novel inhibitors of cyclin-dependent kinases (CDKs), particularly CDK/cyclin complexes. It provides a recombinant transfection system (A) that comprises: (i) first gene construct comprising a sequence encoding an inhibitory polypeptide containing at least one CDK-binding motif for binding and inhibiting activity of a CDK, linked to a transcription regulator functional in eukaryotic cells; (ii) second gene construct comprising a sequence encoding a polypeptide that promotes endothelialisation, and (iii) a gene delivery composition for delivering the GCs to a cell for transfection. Also provided are nucleic acids encoding a fusion protein (FP) containing: (i) a therapeutic
                                                                                                                                                                                                                 Fusion and chimaeric proteins including cyclin-dependent kinase binding motif - used for regulation of cell proliferation and differentiation, for treatment of, e.g. vascular injury, cancer:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cyclin-dependent kinase; CDK; CDK/cyclin complex; inhibitory; restenosis; CDK-binding motif; endothelialisation; fusion protein; therapeutic; acne; intracellular; transceptosis; vascular wound; repair; halr; smooth muscle; cardiovascular; arteriosclerotic; fibrotic disorder;

The FP CC consists of at least one CDK-binding motif and a TCP. (A) are used to CC treat vascular wounds that involve a break in the endothellum and CC excessive proliferation of smooth muscle, particularly restenosis but CC lesions or for endothelialisation of synthetic vascular grafts. More Generally FP are used to treat unwanted cellular proliferation in a very wide range of situations, e.g. for treating vascular diseases as above; CC tumours (gliomas, leukaemias); chronic inflammation; neurodegeneration; CC acne; also to control hair growth (e.g. to prevent hair loss caused by CC chemotherapy or radiation); periodontal disease; to treat tachycardia; CC of thibit spermatogenesis etc. Chimaeric proteins comprising CDK-binding CMC control may also be used to produce FP in cell cultures, for CC production or for regulating cell differentiation in vitro. The present sequence represents a human p27-p16 fusion protein.

The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays to synchronise cell growth in cultured cells.
                                                                                                                                                                                                                                                                                                                                                                                     Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprising (active fragments of) an INK4 family protein and a CIP/KIP family protein (see AAY96046 and AAY96049). The method is to inhibit mammalian smooth muscle cell hyperproliferation, induced by injury caused by angioplasty, stent placement or vein engraftment. It is useful for treating vascular pathologies e.g., restenosis. Also claimed are recombinant lentiviruses encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (Gly4Ser)3 hinge and the human pl6 protein (see AMY96053). It is encoded by a nucleic acid obtained by PCR amplification of p27 and p16 DNAs using primers that also included codons for the tag/hinge regions. A claimed method for inhibiting smooth muscle cell hyperproliferation involves transducing smooth muscle cells with a replication-deficient recombinant adenovirus that lacks functional E1 and E4 regions, and comprises a transgene encoding a cyclin dependent kinase inhibitor (CDKi). The CDKi is selected from an INK4 family protein such as human p16, a CIP/KIP family protein such as p27, active fragments of these, or fusion proteins
